

Sonar Bookends InSeq cannot update text boxes from master pages unless they have been overridden.

The third-party Applescripts in this folder are used to override and to remove the override of text boxes on master pages.

The scripts make overriding of master page items, and removal of that overriding, simple.

You specify which text boxes on a master page that you want overridden by specifying a script label for those text boxes. The ReadMe files cover how this is done.

Virginia Systems does not either warrant or support these scripts. They are provided as a convenience to our customers.

Thanks to customer Brad Walrod for developing and supplying the scripts.
